

Microchip in the Vaccine

"I've heard a lot of talk about microchips being in the COVID vaccines as a way for the government to keep tabs on all of us. Then, two weeks after my daughter got the vaccine, she was stopped at airport security because her left arm was setting the alarm off! I'm sure it's the microchip they put in there..."

"I've heard this too, but as someone who gives plenty of vaccines, I can tell you this isn't possible for several reasons: 1) the microchip would be too large to fit through the tiny hole in the needle, 2) the microchip would require a power source to transmit a signal, and 3) it would have to transmit a signal through an inch of muscle and fat and skin to a remote device. It's not really possible for a microchip to work in this way."

"Also, there are no metals in COVID-19 vaccines or any ingredients that can produce an electromagnetic field, so the vaccine doesn't make you magnetic."
